

## SEG Cloud: Blended Threat Results

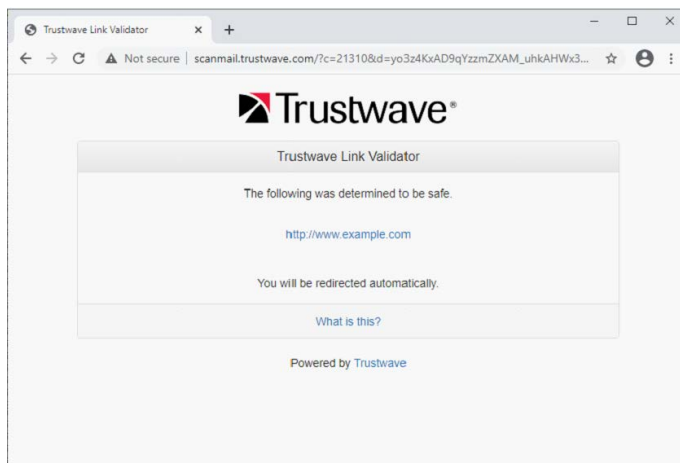

Trustwave SEG Cloud performs real-time scanning of web links (URLs) in email messages to protect against malware-infected sites.

URLs in the message subject and body are updated so that the URL content can be scanned in real time.

When the user clicks a rewritten URL, the Blended Threats server scans the page. If the content is blocked the user will see a result similar to the below.

If a link is determined to be safe, the site briefly displays a link as below, before redirecting the user:

In rare cases the service may encounter a problem scanning the link. The user will be informed of the issue, and that the link could not be scanned. The user can click a link on the validator page to go directly to the site.
